THE PROBLEM

Every figure typed by hand. Every audit.

Clients hand over their asset schedules as PDFs, SAP prints and scans — a new layout every time. An assistant copies each number into the Arbeitsversion. One typo, and the audit stands on it.

THE RULE

Deterministic.

A wrong number and the audit fails.

So purely deterministic code extracts every number and matches it to its source.

No LLM writes a figure. Every value points to its page and box, or Excel cell.

HOW IT WORKS

Four stages, all deterministic.

01 Read

Excel cells, PDF characters, scans through Tesseract OCR

02 Understand

Number grammar to exact cents; header vocabulary to fields

03 Check

Row laws and subtotal sums flag problems; OCR must add up

04 Write

Arbeitsversion per year, pointer per cell, JSON audit trail

```
$ carthagents --input docs --output out
```
